

VENICE CONDENSATE PROJECT

SLS was secured by Kiewit/Enbridge Offshore Facilities, LLC to create a new barge slip through mechanical dredging, constructed levees and managed and stabilized dredge spoils. This specialized slip was created to accommodate custom condensate unit being transported from Ingleside, Texas to Venice, LA.

Project required SLS to pull and replace piling and slip fencing. The office unit was relocated to a temporary site and a platform was demolished in advance of barge offload. SLS also constructed a pad for temporary storage and construction office trailers.

Logistical challenges included working with virgin material, in-plant work, navigating pipeline crossings, weather-related challenges and the impacts experienced by the Deepwater Horizon (BP) oil spill.

PROJECT SUMMARY

- Created specialized barge slip
- Pulled, replaced pilings, relocation of office sites and platform demolition

The above are highlights of recent projects. A more comprehensive list of company projects is available upon request. References for the aforementioned projects, as well as general company, financial, insurance and bonding references are also available upon request.
